**METHOD OF USING CYCLOOXYGENASE-2 INHIBITORS
IN THE TREATMENT AND PREVENTION OF NEOPLASIA**

Field of the Invention

5 This invention is in the field of the prevention and treatment of neoplasia. More specifically, this invention relates to the use of cyclooxygenase-2 inhibitors or derivatives thereof in preventing and treating neoplasia.

10 **Background of the Invention**

Prostaglandins play a major role in the inflammation process and the inhibition of prostaglandin production, especially production of PGG₂, PGH₂ and PGE₂, has been a common target of anti-inflammatory drug discovery.

15 However, common non-steroidal anti-inflammatory drugs (NSAID's) that are active in reducing the prostaglandin-induced pain and swelling associated with the inflammation process are also active in affecting other prostaglandin-regulated processes not associated with the

20 inflammation process. Thus, use of high doses of most common NSAID's can produce severe side effects, including life threatening ulcers, that limit their therapeutic potential. An alternative to NSAID's is the use of corticosteroids, which also produce adverse effects,

25 especially when long term therapy is involved.

NSAIDs have been found to prevent the production of prostaglandins by inhibiting enzymes in the human arachidonic acid/prostaglandin

30 pathway, including the enzyme cyclooxygenase (COX). The recent discovery of an inducible enzyme associated with inflammation (named

"cyclooxygenase-2" (COX-2) or "prostaglandin G/H synthase II") provides a viable target of

35 inhibition which more effectively reduces inflammation and produces fewer and less drastic side effects.

Compounds which selectively inhibit cyclooxygenase-2 have been described in U.S. patents 5,380,738, 5,344,991, 5,393,790, 5,434,178, 5,474,995, 5,510,368 and WO documents WO96/06840, WO96/03388, WO96/03387, WO96/25405, WO95/15316, WO94/15932, WO94/27980, WO95/00501, WO94/13635, WO94/20480, and WO94/26731.

Neoplastic disease states are serious and oftentimes life-threatening conditions. These neoplastic diseases, which are characterized by rapidly-proliferating cell growth, continue to be the subject of worldwide research efforts directed toward the identification of therapeutic agents which are effective in the treatment thereof. Effective therapeutic agents prolong the survivability of the patient, inhibit the rapidly-proliferating cell growth associated with the neoplasm, or effect a regression of the neoplasm. Research in this area is primarily focused toward identifying agents which would be therapeutically effective in humans and other mammals.

Recently, the presence of COX-2 has been observed in neoplastic disease. See Masanobu Oshima et al. (Cell, 87, 803-809 (1996); and Michelle Parret et al. (International Journal of Oncology, 10, 503-507 (1997)).

[Pyrazol-1-yl]benzenesulfonamides have been described as inhibitors of cyclooxygenase-2 and have shown promise in the treatment of inflammation, arthritis, and pain, with minimal side effects in pre-clinical and clinical trials. Their use for preventing colon cancer has been described in U.S. Patent No. 5,466,823. However, their use for treating colon cancer or for treating or preventing other neoplasias has not been previously described.

The present invention is directed to the use of inhibitors of cyclooxygenase-2 for the treatment and prevention of neoplasias. Conjunctive treatment of a selective cyclooxygenase-2 inhibitor with other
5 neoplastic agents produces a synergistic effect or alternatively reduces the toxic side effects associated with chemotherapy by reducing the concentration of the side effect-causing agent needed for therapeutic efficacy.

10

Detailed Description of the Invention

The present invention provides a method for treating or preventing a neoplasia that produces a prostaglandin in a subject in need of such treatment or prevention, the
15 method comprises treating the subject with a therapeutically effective amount of a cyclooxygenase-2 inhibitor or derivative thereof.

The term "treatment" includes partial or total
20 inhibition of the neoplasia growth, spreading or metastasis, as well as partial or total destruction of the neoplasia cells.

The term "prevention" includes either preventing the
25 onset of clinically evident neoplasia altogether or preventing the onset of a preclinically evident stage of neoplasia in individuals at risk. Also intended to be encompassed by this definition is the prevention of initiation for malignant cells or to arrest or reverse
30 the progression of premalignant cells to malignant cells. This includes prophylactic treatment of those at risk of developing the neoplasia.

The phrase "therapeutically-effective" is intended
35 to qualify the amount of each agent which will achieve the goal of improvement in disease severity and the frequency of incidence over treatment of each agent by

itself, while avoiding adverse side effects typically associated with alternative therapies.

The term "subject" for purposes of treatment
5 includes any human or mammal subject who has any one of the known neoplasias, and preferably is a human subject. For methods of prevention, the subject is any human or animal subject, and preferably is a human subject who is at risk for obtaining an epithelium cell-derived
10 neoplasia. The subject may be at risk due to exposure to carcinogenic agents, being genetically predisposed to have the neoplasia, and the like.

The term "neoplasia" includes neoplasia that produce
15 prostaglandins or express a cyclooxygenase, including both benign and cancerous tumors, growths and polyps.

In the method above, the neoplasia that produce prostaglandins include brain cancer, bone cancer,
20 epithelial cell-derived neoplasia (epithelial carcinoma) such as basal cell carcinoma, adenocarcinoma, gastrointestinal cancer such as lip cancer, mouth cancer, esophageal cancer, small bowel cancer and stomach cancer, colon cancer, liver cancer, bladder cancer, pancreas
25 cancer, ovary cancer, cervical cancer, lung cancer, breast cancer and skin cancer, such as squamous cell and basal cell cancers, prostate cancer, renal cell carcinoma, and other known cancers that effect epithelial cells throughout the body. Preferably, neoplasia is
30 selected from gastrointestinal cancer, liver cancer, bladder cancer, pancreas cancer, ovary cancer, prostate cancer, cervical cancer, lung cancer, breast cancer and skin cancer, such as squamous cell and basal cell cancers.

The COX-2 inhibitors can also be used to treat the
35 fibrosis which occurs with radiation therapy. The method can be used to treat subjects having adenomatous polyps, including those with familial adenomatous polyposis

(FAP). Additionally, the method can be used to prevent polyps from forming in patients at risk of FAP.

Inhibitors of the cyclooxygenase pathway in the metabolism of arachidonic acid used in the prevention and treatment of epithelial cell derived neoplasias may inhibit enzyme activity through a variety of mechanisms. By the way of example, the inhibitors used in the methods described herein may block the enzyme activity directly by acting as a substrate for the enzyme. The use of cyclooxygenase-2 selective inhibitors is highly advantageous in that they minimize the gastric side effects that can occur with non-selective NSAID's, especially where prolonged prophylactic treatment is expected.

The term "cyclooxygenase-2 inhibitor" denotes a compound able to inhibit cyclooxygenase-2 without significant inhibition of cyclooxygenase-1. Preferably, it includes compounds which have a cyclooxygenase-2 IC_{50} of less than about 0.2 μM , and also have a selectivity ratio of cyclooxygenase-2 inhibition over cyclooxygenase-1 inhibition of at least 50, and more preferably of at least 100. Even more preferably, the compounds have a cyclooxygenase-1 IC_{50} of greater than about 1 μM , and more preferably of greater than 10 μM . Pyrazoles can be prepared by methods described in WO95/15316, WO95/15315 and WO96/03385. Thiophene analogs can be prepared by methods described in WO 95/00501 and WO94/15932. Oxazoles can be prepared by the methods described in PCT documents WO95/00501 and WO94/27980. Isoxazoles can be prepared by the methods described in WO96/25405. Imidazoles can be prepared by the methods described in WO96/03388 and WO96/03387.

Cyclopentene cyclooxygenase-2 inhibitors can be prepared by the methods described in U.S. Patent No. 5,344,991 and WO 95/00501. Terphenyl compounds can be prepared by the methods described in
 5 WO96/16934. Thiazole compounds can be prepared by the methods described in WO96/03392. Pyridine compounds can be prepared by the methods described in WO96/24584 and WO96/24585.

10 The method provided herein relates to the use of cyclooxygenase-2 inhibitors or derivatives thereof in the prevention and treatment of derived neoplasias. In the preferred embodiments, the cyclooxygenase-2 compound is selected from the compounds of Formula I

Biological Evaluation

The efficacy of cyclooxygenase-2 inhibitors as antineoplasia agents was determined in the following models:

35

Murine Lewis lung Carcinoma Mod 1.

Lewis lung carcinomas were implanted sub-cutaneously into the foot pad of male C57BL/6 mice. The mice were subsequently treated with 4-[5-(4-chlorophenyl)-3-(difluoromethyl)-1H-pyrazol-1-yl]benzenesulfonamide. The drug was supplied in the drinking water at 6 mg/kg/day. Also a non-selective COX-1/COX-2 inhibitor indomethacin was tested in this model. The drug was supplied in the drinking water at the maximum tolerated dose of 2 mg/kg/day. A total of 10 mice/compound were tested. Tumor volume was determined twice a week using a plethysmometer. The efficacy of these compounds on tumor growth was measured at day 32 after cancer cell injection, as indicated in Table 1. The % inhibition value is calculated by calculating the difference in tumor size compared with the control group.

Table 1.

Tumor Volume (Day 32)

Treatment	% Inhibition
Vehicle/control	0.00
COX-2 inhibitor	70.86
Indomethacin	62.90

Human prostate cancer cell tumors

Two human prostate cancer cell lines (PC-3 and LNCaP) were obtained (ATCC) to determine the efficacy of cyclooxygenase-2 inhibitors to inhibit tumor growth in a therapeutic model. In addition, the LNCaP cell line secretes prostate serum antigen (PSA) when grown in nude mice.

PC-3

PC-3 cells (10^6 cells/0.2 ml of 30% matrigel) in RPMI 1640 medium was injected on the back of nude mice. At day

28, a COX-2 inhibitor 4-[5-(4-chlorophenyl)-3-(difluoromethyl)-1H-pyrazol-1-yl]benzenesulfonamide (20 mg/kg/day in water) was administered. After 45 days, PGE₂ and TXB₂ were measured. The COX-2 inhibitor inhibited tumor growth by 55%. PGE₂ and TXB₂ levels were reduced by 80-90% in the animals treated with the COX-2 inhibitor.

LNCaP

Similar to the results in PC-3, a COX-2 inhibitor 4-[5-(4-chlorophenyl)-3-(difluoromethyl)-1H-pyrazol-1-yl]benzenesulfonamide at a dose equivalent to 6 mg/kg/day in the drinking water inhibited the growth of the tumor by 55% at day 58. PSA level was reduced to approximately 50% as judged by western blotting.

Combination Therapy of a COX-2 inhibitor and other
antineoplastic agents

Lewis Lung carcinoma cells (2.5×10^6 cells) prepared from a brei carried in C57BL/6 mice were injected subcutaneously into the hind legs of mice. A COX-2 inhibitor, 4-[5-(4-chlorophenyl)-3-(difluoromethyl)-1H-pyrazol-1-yl]benzenesulfonamide was given by gavage twice a week to groups of 10 mice at doses of 6 and 20 mg/kg. Cyclophosphamide (CTX) was injected to mice on days 5, 7 and 9 after the implantation of the tumor at a dose of 50 mg/kg. Tumor volume was determined during the study. Animals were sacrificed at day 26 and the results of this experiments are summarized in Table 2. The % inhibition was calculated as above.

Table 2.

Tumor Volume (Day 22)

Treatment	% Inhibition
Vehicle	0
COX-2 inhibitor (6 mg/kg)	0
COX-2 inhibitor (20 mg/kg)	54
CTX (50 mg/kg)	57
CTX+COX-2 inhibitor (6 mg/kg)	69
CTX+COX-2 inhibitor (20 mg/kg)	77

The results of this experiment indicate that the combination of a COX-2 inhibitor and a cytotoxic agent produced an additive effect on their individual capacity to inhibit tumor growth.

Methods for preparation of the antineoplastic agents described above may be found in the literature. Methods

for preparation of doxorubicin, for example, are described in U.S. Patents No. 3,590,028 and No. 4,012,448. Methods for preparing metallomatrix protease inhibitors are described in EP 780386. Methods for
5 preparing SOD mimics are described in EP 524,101. Methods for preparing α,β , inhibitors are described in WO97/08174.

The phrase "conjunctive therapy" (or "combination
10 therapy"), in defining use of a cyclooxygenase-2 inhibitor agent and another pharmaceutical agent, is intended to embrace administration of each agent in a sequential manner in a regimen that will provide beneficial effects of the drug combination, and is
15 intended as well to embrace co-administration of these agents in a substantially simultaneous manner, such as in a single formulation having a fixed ratio of these active agents, or in multiple, separate formulations for each agent. The present invention also comprises a
20 pharmaceutical composition for the prevention and treatment of neoplasia, comprising a therapeutically-effective amount of a compound of Formula I in association with at least one pharmaceutically-acceptable carrier, adjuvant or diluent (collectively referred to
25 herein as "carrier" materials) and, other antineoplastic agents or other growth inhibiting agents or other drugs or nutrients.

For oral administration, the pharmaceutical
30 composition may be in the form of, for example, a tablet, capsule, suspension or liquid. The pharmaceutical composition is preferably made in the form of a dosage unit containing a particular amount of the active ingredient. Examples of such dosage units are capsules,
35 tablets, powders, granules or a suspension, with conventional additives such as lactose, mannitol, corn starch or potato starch; with binders such as crystalline

cellulose, cellulose derivatives, acacia, corn starch or gelatins; with disintegrators such as corn starch, potato starch or sodium carboxymethyl-cellulose; and with lubricants such as talc or magnesium stearate. The
5 active ingredient may also be administered by injection as a composition wherein, for example, saline, dextrose or water may be used as a suitable carrier.

For intravenous, intramuscular, subcutaneous, or
10 intraperitoneal administration, the compound may be combined with a sterile aqueous solution which is preferably isotonic with the blood of the recipient. Such formulations may be prepared by dissolving solid active ingredient in water containing physiologically compatible
15 substances such as sodium chloride, glycine, and the like, and having a buffered pH compatible with physiological conditions to produce an aqueous solution, and rendering said solution sterile. The formulations may be present in unit or multi-dose containers such as
20 sealed ampoules or vials.

If the neoplasia is localized in the G.I. tract, the compound may be formulated with acid-stable, base-labile coatings known in the art which begin to dissolve in the
25 high pH small intestine. Formulation to enhance local pharmacologic effects and reduce systemic uptake are preferred.

Formulations suitable for parenteral administration
30 conveniently comprise a sterile aqueous preparation of the active compound which is preferably made isotonic. Preparations for injections may also be formulated by suspending or emulsifying the compounds in non-aqueous
solvent, such as vegetable oil, synthetic aliphatic acid
35 glycerides, esters of higher aliphatic acids or propylene glycol.

Formulations for topical use include known gels, creams, oils, and the like. For aerosol delivery, the compounds may be formulated with known aerosol exipients, such as saline, and administered using commercially available nebulizers. Formulation in a fatty acid source may be used to enhance biocompatibility. Aerosol delivery is the preferred method of delivery for epithelial neoplasias of the lung for prevention application.

For rectal administration, the active ingredient may be formulated into suppositories using bases which are solid at room temperature and melt or dissolve at body temperature. Commonly used bases include cocoa butter, glycerinated gelatin, hydrogenated vegetable oil, polyethylene glycols of various molecular weights, and fatty esters of polyethylene stearate.

The dosage form and amount can be readily established by reference to known neoplasia treatment or prophylactic regimens. The amount of therapeutically active compound that is administered and the dosage regimen for treating a disease condition with the compounds and/or compositions of this invention depends on a variety of factors, including the age, weight, sex and medical condition of the subject, the severity of the disease, the route and frequency of administration, and the particular compound employed, the location of the neoplasia, as well as the pharmacokinetic properties of the individual treated, and thus may vary widely. The dosage will generally be lower if the compounds are administered locally rather than systemically, and for prevention rather than for treatment. Such treatments may be administered as often as necessary and for the period of time judged necessary by the treating physician. One of skill in the art will appreciate that the dosage regime or therapeutically effective amount of the inhibitor to be administered may need to be optimized

for each individual. The pharmaceutical compositions may contain active ingredient in the range of about 0.1 to 2000 mg, preferably in the range of about 0.5 to 500 mg and most preferably between about 1 and 200 mg. A daily
5 dose of about 0.01 to 100 mg/kg body weight, preferably between about 0.1 and about 50 mg/kg body weight, may be appropriate. The daily dose can be administered in one to four doses per day.

10 All patents and documents referenced herein are incorporated by reference.

Although this invention has been described with respect to specific embodiments, the details of these
15 embodiments are not to be construed as limitations.

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
see FURTHER INFORMATION sheet PCT/ISA/210
2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

Claims Nos.: 1-20

because they relate to subject matter not required to be searched by this Authority, namely:

Rule 39.1(iv) PCT - Method for treatment of the human or animal body by therapy

Remark : Although claims 1-20 are directed to a method of treatment of the human/animal body , the search has been carried out and based on the alleged effects of the compound/composition.
